#### Search Notes

Dear Examiner Davis,

See attached results.

If you have any questions about this search feel free to contact me at any time.

Thank you for using STIC search services!

Chan, Christina

Subject:

Rush search request for 09/277064

Please search in commercial database, issued patent files and PGPUB:

The peptide SEQ ID NO:9, with size limitation for the sequences in the database to the size of SEQ ID NO:9.

Thank Iyou.

MINH TAM DAVIS

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 14,

Sequence 14, Application US/08305871A

Sequence 14, Application US/08305871A

Patent No. 2736142

GENERAL INFORMATION:

APPLICANT: Sette, Alessandro

APPLICANT: Sidney, Howard M.

APPLICANT: Alexander, Jeffrey L.

TITLE OF INVENTION: Alteration of Immune Response Using Pan TITLE OF INVENTION: Alteration of Emula Peptides

NUMBER OF SEQUENCES: 29

CORRESPONDENCE ADDRESS:

ADDRESSEE: Townseand and Townseand and Crew LLP

STREET: Two Embarcadero Center, Eighth Floor

COUNTRY: USA

COUNTRY: USA

A compan. which induces a cytotoxic T lymphocyte (CTL) response to a hepatitis B virus (HBV) antigen (Ag) in a mammal comprises, a HBV CTL Ag response inducting peptide (i.e. ART/8929) and a lipid conjugated helper T cell inducing peptide. The compan. is useful in the treatment and prevention of hepatitis B. (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                       This is a T helper epitope peptide, the sequence of which is derived from hepatitis B virus (HBV) core antigen amino acids 128-140. It may be used in a conjugate with cytotoxic T-lymphocyte stimulating (CTL) peptides to enhance an individual's immunity by providing cell-mediated immunity and protective antibodies. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                      Cytotoxic T-lymphocyte stimulating peptide(s) - derived from hepatitis B virus useful for treating, preventing and diagnosing infection.

Peptide AAW39439 is a mouse H-2 I-Ab restricted HBV Core antigen-derived T helper epitope which is injected into HLA-*0201Kb transgenic mice. The method involves the identification of peptide sequences capable of binding to an HLA (human leukcyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and WHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially 1-cell peptide epitopes with strong anti-tumour and anti-viral
                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             T cell epitope; immune response; human leukocyte antigen; HLA Class l
vaccine; immunogenic; major histocompatablilty complex; MHC; B cell;
disease; anti-tumour; anti-viral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse H-2 I-Ab-restricted HBV core antigen-derived T helper epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method of selecting T cell peptide epitope(s) - by measuring the stability of HLA class I-peptide complexes on intact B cells.

                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MHC molecules, which are encoded by most of the alleles of a DR locus. The peptide can be used to inhibit or induce MHC class II mediated activation of T-cells or helper T-cells, which especially humans, to inhibit T-cell mediated events involved in allograft rejection, allergic response and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered inmunogen. The peptide can be used with other immunogens to treat, e.g. proseate cancer, hepatitis B, hepatitis C, AIDS, renal and cervical carcinoma, lymphoma, CMV and condylyloma acuminatum
                                                                                                                                                                                                                                                                                                                                                         Peptides that bind to MHC molecules of all DR alleles - inhibiting or inducing MHC Class II mediated activation of T cells.

This sequence represents a hepatitis B virus (HBV) core antigen MHC class II epitope, encoded by the ISOT fusion gene (AAZ38617), used in an exemplification of the present invention. The invention relates to a novel expression of the present invention. The invention relates to a comprising a promoter operably linked to a fusion gene encoding a major histocompatibility complex (MHC) targetting sequence, and two or more heterologous peptide epitopes. The MHC class I epitope to a cytosolic pathway or to the endoplasmic creticulum, or an MHC class II targetting sequence, which directs creticulum, or an MHC class II targetting sequence, which directs creticulum, or an MHC class II targetting sequence, which directs extracellular antigens to enter the endocytic pathway to be processed into antigen peptides for presentation on MHC class II molecules. The heterologous epitopes may comprise either helper T lymphocyte (HTL) epitopes such as a pan DR epitope (TCL) epitope and a universal HTL epitope such as a pan DR epitope (TCL) epitope and a universal HTL epitope such as a pan DR epitope (MDRE). The vectors are useful for stimulating an immune response in vivo, as well as for use in assaying conhuman immunogenicity of a human T cell peptide epitope in vivo in a non-human mammal. They provide a nucleic acid vaccine for enhancing immunity against infectious pathogens, such as viruses (e.g., HIV, hepatitias B (HBV and hepatitis C (HVV)) bacteria, processe in the pathogens are advantageously combined with other MHC class II epitopes are advantageously combined with other MHC class II epitopes are advantageously combined with other MHC class II epitopes are advantageously combined with other MHC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

```
The invention relates to polynuclectide containing at least a part of the coding sequence of the middle glycoprotein of hepatitis B virus (HBV) in which is inserted a DNA sequence coding for an epitope comprising at least one viral, fungal, bacterial, or tumour epitope of an antigen, capable of inducing a cellular response. Nucleic acids and compositions of the invention are useful for inducing in vivo a CTL (cytocoxic T lymphocyte) response against several epitopes of one or more, bacterial, viral, fungal, or tumour antigens. A composition of the invention produces an immune response against HIV antigen and are used in the production of vaccines. The polynucleotides of the invention are also used in gene therapy. The present sequence is hepatitis B virus, helper peptide. This peptide is co-injected with human epitopes in order to elicit HLA (human leucocyte antigen) -A2.1-restricted CTL response in
                                                                                                                                                                                                                                                 New polynucleotide comprising at least one viral, fungal, bacterial, tumor epitope of an antigen, capable of inducing a cellular response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumour epitope, cytostatic; immunostimulant; gene therapy; middle glycoprotein; Hepatitis B virus core; cytotoxic response; immune response; cytotoxic I lymphocyte; CTL; HBVc; HLA; human leucocyte antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 74; DB 4; Length 13; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identification of cytotoxic T cell lymphocyte (CTL) epitopes (AAM2216-AAM23484) that generate anti-HIV activity. CTL are a major protective mechanism against viral diseases. Antibodies may neutralise extracellular human immunodeficiency virus (HIV) and limit or prevent infection of cells in the host, but CTL will limit viral production by Killing the cell. The CTL epitopes are useful in medicine, in the manufacture of vaccines or diagnostic agents. The present sequence is that of a T-helper epitope peptide useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiviral;

```
Novel polynucleotide having DNA sequence encoding tumor antigen epitope inserted in part of coding sequence of middle glycoprotein of hepatitis B virus, used to induce immune response against tumor-specific antigen.
                                                                                                                                                                                                                               containing a DNA sequence coding for at least one tumour epitope of a glycoprorted into part of the coding sequence of the middle glycoprorted of the Hepatitis B virus (HBV). The polymucleotide is useful for optionally evaluating cytocoxic responses in the individual's lymphocyte population. It induces an immune response against at least one tumour specific antigen or tissue specific antigen. The vector comprising the polymucleotide induces in vivo, cellular and/or humona immune response. The composition comprising the polymucleotide induces in vivo, cellular and/or humona immune response. The composition comprising the polymucleotide induces in vivo, cytocoxic T lymphocyte (CTL) against one or more antigens or epitopes cytocoxic T lymphocyte (CTL) against one or more antigens or epitopes therapy. The present sequence is a Hepatitis B virus core (HBVC) tumour epitopic peptide. This peptide elicits HLA (human leucocyte antigen)-A2.1 restricted CTL response in mice
                                                                                                                                                                                                               present invention relates to an isolated or purified polynucleotide
                                                                                                                                                  Example 1; Page 13; 36pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 13 AA;

Enhancing immunogenicity of peptide containing class I epitope, useful for treating cancer, comprises providing (semi-)conservative amino acid substitutions at specified positions of these epitopes.

Disclosure, Fig 1A; 96pp; English

This invention relates to a method of enhancing the immunogenicity of a peptide, where the peptide contains a class I epitope. The invention includes methods for preparing peptides containing epitopes which have enhanced ability to effect an immune response (compared to wild-type

```
epitopes). The peptides are referred to as heteroclitic analogues. The method is useful for eliciting an immune response by contacting CTLs with the immunogenically enhanced peptide in vitro in the presence of an antigen presenting cell, or by administering to a subject a nucleic acid molecule comprising a nucleotide sequence encoding the peptide. The peptides are useful as reasents to evaluate an immune response and the efficacy of the vaccine, and for making antibodies. The heteroclitic analogues are useful in immunological compositions for the treatment of viral diseases, cancer, and other conditions which are characterised by displayed antigens on target cells. The present sequence represents a class I epitope which may be used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of a hepatitis B virus core antigen (HBVc) peptide comprising amino acid residues 128-140. The peptide was used to immunise HHD mice and results were compared with those obtained using human telomerase reverse transcriptase (hTRT) HLA-A2.1+ restricted peptide p540 (see AAB82772). The induction of CTL responses in vitro and in vivo, and the susceptibility to lysis of tumour cells of various origins by hTRT CTL suggest that hTRT could serve as a universal cancer vaccine for humans. A claimed universal vaccine for treating tumours of any origin comprises at least 1 hTRT peptide. The peptide is 7-15 amino acid residues in length and may be modified to enhance binding to the major histocompatibility complex. Also claimed is a method for inducing and enhancing a CTL response against cancer cells, involving harvesting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine for initiating and enhancing a cytotoxic T lymphocyte response, for treating cancers or tumors or for inducing immune response against tumors, comprises a telomerase reverse transcriptase peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Telomerase reverse transcriptase; hTRT; human; cytotoxic T lymphocyte; major histocompatibility complex; cancer; tumour; human leucocyte antigen; HLA-A2.1; HBVc; vaccine.

Derivative antigenic peptides of MUC1 protein bind at least one major histocompatibility complex class I (MHC-1) glycoprotein, which activates cytotoxic T lymphocytes to induce a protective response against tumours. Diagnossis of cancer involves determining the presence or absence in a chost cell of MHC class I restricted T cell response to a MUC1 derivative, where the presence of the MHC class I restricted T cell response to a MUC1 derivative, indicates that the host has cancer. Measurement of the level of MHC class I restricted T cell response is also useful to monitor the severity of cancer, a larger response indicating a more severe cancer. MUC1 derivatives are useful in cancer therapy and to follow MUC1 specific immune responses in patients during the course of disease and/or
                                                                                                                                                                                                                                                                                                    ö

The invention relates to an isolated or purified peptide (I) which binds Hepatitis B virus (HBV) core antigen (HBcAg) or HBV E antigen (HBeAg).

(I) is useful for treating or preventing Hepatitis B virus (HBV) infection, by identifying a subject in need of a molecule that inhibits of HBV infection, and providing the subject with (I). (I) is also useful for determining the presence of HBV in a biological sample, and for inhibiting B cell mediated processing and uptake of HBCAg and/or HBeAg, by determining whether (I) inhibits B cell mediated processing and uptake of HBCAg and/or HBeAg, by performing an assay of T cell proliferation or cytokine production. (I) is also useful for meduating an immune system response. (I) is useful as a template for a design of synthetic molecules including peptides, derivatives or modified peptides, peptidomimetics and chemicals. (I) is also useful as biotechnological tool, diagnostic reagents in conventional immunohistochemical techniques, as diagnostic reagents to detect HBV in biological sample, and to determine the efficacy of an HBV treatment protocol by monitoring the levels of HBCAg and/or HBeAg during and after treatment. The present invention relates to ligand/receptor specificity exchangers comprising at least one specificity domain comprising a ligand for a receptor, and at least one antigenic domain joined to the specificity domain, where the antigenic domain comprises an epitope of a pathogen toxin. The ligand/receptor specificity exchangers redirect antibodies to receptors present on pathogens. They are useful for preventing and treating human diseases such as bacterial, viral, yeast, parasitic and fungal infections, and cancer. These compositions act by inhibiting proliferation of pathogens, or cancer cells. One of the prophylactic applications of the ligand/receptor specificity exchangers includes coating or crosslinking it to a medical device or implant which include implantable medical devices that tend to serve as foci for infection by a number of bacterial species. ABG62863 represent antigenic domain peptides used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel ligand/receptor specificity exchanger that redirects antibodies to receptors on pathogen or tumor cell, has specificity domain having ligand for receptor, and antigenic domain having epitope of pathogen or toxin.
                                            Ligand/receptor specificity exchanger; antibody; pathogen receptor; bacterial infection; viral infection; yease infection; cancer; parasitic infection; fundal infection; proliferation; antibacterial; virucide; cytostatic, antifungal; antigenic domain.
Antigenic domain peptide from a Hepatitis B virus protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 14; Page 14; 79pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying subdominant or cryptic epitopes, useful in immunotherapy of cancer and viral infection, comprises testing modified, non-immunogenic peptides for induction of cytotoxic T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to subdominant/cryptic epitopes that are presented by HLA (human leukocyte antigen) Class I molecule A2.1. The epitopes or chimeric polypeptides containing them and nucleic acid encoding them are useful for preventative or curative immunotherapy of cancer and viral infections, particularly where used as vaccines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                              manufacturing medicament for stimulating a cytotoxic T cell response and for preventing or treating cancer, e.g. colorectal, lung, breast or ovarian cancer.
                                                                                                                                                                                                                                                                                                              The present invention describes the use of a polypeptide (I) in the manufacture of a medicament for stimulating a cytotoxic T cell response, where (I) comprises a first portion comprising the part of human Fc that binds to CD64 and a second portion comprising one or more heterologous T cell epitopes. Also described is a method of stimulating a cytotoxic T cell response in a patient such as a mammal, preferably human, by administering (I) to the patient. (I) has cytostatic activity and can be used in vaccine production. (I) and the nucleic acid encoding (I) are useful in the manufacture of a medicament for stimulating cytotoxic T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cytotoxic I lymphocyte, CTL, I helper, MAGE3; cytotoxic I cell response; tumour; immune response; cancer; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              cell response. The medicament is useful for preventing and/or treating cancer, e.g. colorectal, lung, breast, gastric or ovarian cancer. The medicament stimulates cytotoxic and helper T cell responses. The antibodies are useful as vaccines to stimulate helper and cytotoxic T cell responses. The polypeptides and nucleic acids are useful in optimisation schedules for enhancing a protective immune response against cancer. The present sequence represents a TH epitope which is used in an example from the present invention

Use of polypeptides and nucleic acids encoding the polypeptides, in manufacturing medicament for stimulating a cytotoxic T cell response and for preventing or treating cancer, e.g. colorectal, lung, breast or ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes the use of a polypeptide (I) in the manufacture of a medicament for stimulating a cytotoxic T cell response, where (I) comprises a first portion comprishing the part of human Fc that binds to CD64 and a second portion comprishing one or more heterologous T cell epitopes. Also described is a method of stimulating a cytotoxic T cell response in a patient such as a mammal, preferably human, by administering (I) to the patient. (I) has cytostatic activity and can be used in vaccine production. (I) and the nucleic acid encoding (I) are useful in the manufacture of a medicament for stimulating cytotoxic T cell response. The medicament is useful for preventing and/or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytotoxic T lymphocyte, CTL; T helper; MAGE3; cytotoxic T cell response; tumour; immune response; cancer; vaccine; antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cancer, e.g. colorectal, lung, breast, gastric or ovarian cancer. The medicament stimulates expotoxic and helper T cell responses. The antibodies are useful as vaccines to stimulate helper and cytotoxic T cell responses. The polypeptides and nucleic acids are useful in optimization immunisation schedules for enhancing a protective immune response against cancer. The present sequence represents a T helper epicope which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of polypeptides and nucleic acids encoding the polypeptides, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

```
manufacture of a medicament for stimulating a polypopulue (1) in the manufacture of a medicament for stimulating a cytocoxic T cell response, where (1) comprises a first portion comprising the part of human Fc that binds to Cofé and a second bortion comprising the part of human Fc that cell epitopes. Also described is a method of stimulating a cytotoxic T cell response in a patient such as a mammal, preferably human, by administering (1) to the patient. (1) has cytostatic activity and can be used in vaccine production. (1) and the nucleic acid encoding (1) are useful in the manufacture of a medicament for stimulating cytotoxic T cell response. The medicament is useful for preventing and/or treating cancer, e.g. colorectal, lung, breast, gastric or ovarian cancer. The medicament stimulates cytotoxic and helper T cell responses. The medicament stimulates cytotoxic antibodies are useful as vaccines to stimulate helper and cytotoxic T cell responses. The polypeptides and nucleic acids are useful in cancer. The present sequence represents a TH epitope which is used in an example from the present invention
manufacturing medicament for stimulating a cytotoxic T cell response and for preventing or treating cancer, e.g. colorectal, lung, breast or ovarian cancer.
                                                                                                                                                                          The present invention describes the use of a polypeptide (I) in the

Immunogenic compositions for protecting against hepatitis B virus infection

Example 4; Col 13; 49pp; English

```
The invention relates to a novel immunogenic composition comprising a peptide that binds to an Major Histocompatibility Complex (MHC) class I malecule to form a complex recognised by a cytotoxic T cell, and a second peptide that binds to an MHC class II molecule to form a complex recognised by a helper T cell (a group in the first peptide comprises a nepatities B virus group). The composition of the invention has virucide and hepatotroppic activity. The cytocoxic T lymphocyte (CTL)-stimulating peptides induce HLA-restricted responses to hepatitis B virus (HBV) antigens. The peptides, derived from CTL group regions of both HBV curface and nucleocapsid antigens are particularly useful in the treatment and prevention of HBV infection, including the treatment of chronically infected HBV carriers. The peptides are also useful in the chronically infected HBV restricts. The peptides are also useful in CTL group regions of both HBV infected hBV carriers. The peptides are also useful in the chronically infected hBV carriers. The peptides are also useful in ABPS1485-BPS59 are peptides used for the production of the immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to purified immunogenic peptide derived from a human immunodeficiency virus 1 (HIV-1) antigen. The immunogenic peptide, encoding polynucleotide and specific antibodies are useful for priming human CD8 cells in vitro. The peptide is useful in a diagnostic method for detecting an early CTL response against HIV-1, by providing a terrameric complex comprising the peptide, incubating the complex with peripheral blood lymphocytes of the subject, and determining the presence of HIV-1 specific CTL. The peptide and polynucleotide are useful for stimulating ex vivo a human immune response against HIV-1. A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel purified immunogenic peptide derived from HIV-1 antigen, for preventing and/or treating HIV-1 infections, for priming human CD8 cells in vitro, or for detecting early cytotoxic T lymphocyte response against

New purified immunogenic Hu antigen peptide for use in a vaccine to induce an immune response against a cancerous cell in a subject, for treating e.g. autologous or syngenic small-cell lung cancer or a nervous system disease.

Disclosure; Page 13; 52pp; English

The invention relates to new purified immunogenic peptides derived from the Hu antigen, a family of nucleoprotein of size 35-40 kD. The sequence is used to generate a number of peptides comprising fragments of the HU antigen. The peptides are used to induce an immune response against a sarcoma or prostate carcinoma. The immune response is an in vitro, exvivo and/or in vivo CDB T-lymphocytes (CTL) response. The administration of the peptides to an HLA-A2.1 human induces the activation of a specific CTL response against autologous or syngenic small-cell lung cancer (SCLC). The sequences can be used used as an antitumoral vaccine, for the treatment or prevention of HLA-A2.1 human SCLC and/or nervous system damage diseases. An animal model is used for selecting therapeutic molecules capable of inducing an immune response in vivo against the peptides induce an immune response against a cancerous cell without inducing an immune response against non-cancerous cells of a

ö
mammal, preferably a human. The peptides are shown in records ABP98764-
BAP98776. This sequence corresponds to a fragment of the hepatitis B
virus core protein comprising amino acids 128-140. The peptide is used as
a control in MHC binding and stabilisation assays

Bradykinin-like peptide - garden dagger wasp
NyAlternate names: Thr-6-bradykinin
C;Sbecies: Megascolia flavifrons (garden dagger wasp)
C;Date: 08-Mar-1989 #sequence_revision 08-Mar-1989 #text_change 05-Oct-2004
C;Accession: A2674
R;Yasuhara, T.; Mantel, P.; Nakajima, T.; Piek, T.
Toxicon 25, 527-535, 1987
A;Title: Two kinins isolated from an extract of the venom reservoirs of the solitary was A;Accession: A2674
A;Accession: A2674
A;Accession: A2674
A;Molecule type: protein
A;Residues: 1-9 <YAS>
                                    hydroxyproline-3-bradykinin - frog (Heleophryne purcelli)
Cispecies: Heleophryne purcelli
Cispecies: Heleophryne purcelli
Cispecies: Heleophryne purcelli
Cidacession: A43065
Rinakajima, T.; Yasuhara, T.; Erspamer, G.F.; Visser, J.
Experientia 35, 1133, 1979
A.Title: Occurrence of Hyp(3)-bradykinin in methanol extracts of the skin of the South Paracession: A43065
A.Reference number: A43065; MUD:80024576; PMID:488255
A.Molecule type: protein
A.Residues: 1-9 <NAK>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ornitho-kinin - chicken

                                                                                                                                                                                                                                                                                                                                                                      Gaps
angiotensin-converting enzyme and enhances the action of bradykinin by inhibiting the kinases that inactivate it. It acts as an indirect hypotensive agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

"Occurrence of a new active peptide on smooth muscle and bradykinin in "Occurrence of a new active peptide on smooth muscle and bradykinin in the skin of Rana nigromaculata hallowell.";
Chem. Pharm. Bull. 16:769-770(1968).
-!- FUNCTION: Induces smooth muscle contraction.
-!- SUBCELLUIAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the bradykinin family.

                                                                                                                                                                                                                                                                                                                                                                  bellied toad (Bombina variegata) skin.";

Bur. J. Blochem. 269:4693-4700(2002).

-!- FUNCTION: Produces in vitro relaxation of rat arrerial smooth muscle and constriction of intestinal smooth muscle.

-: SUBCELDULAR LOCATION: Secreted.

-: TISSUE SPECIFICITY: Expressed by the skin glands.

-: SINILARITY: Belongs to the bradykinin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Amphibian defense peptide; Bradykinin; Direct protein sequencing; Vasoactive; Vasodilator.

                                                                   -!- FUNCTION: Both proteins have bradykinin-like, although lower activities (e.g. smooth muscle contraction).
-!- SUBCELLULAR LOCATION: Secreted; venom reservoirs.
-!- SIMILARITY: Belongs to the bradykinin family.
